

Exploring Open Source GIS Programming

Scott Parker, Katie Urey, Jack Newlevant,
Mele Sax-Barnett

When to write a program

- When you expect your tool to have multiple uses and/or multiple iterations
- Something new or different that has to be fast, precise, accurate, reliable
- Need to match the user's model

When to write a program

What is open source?

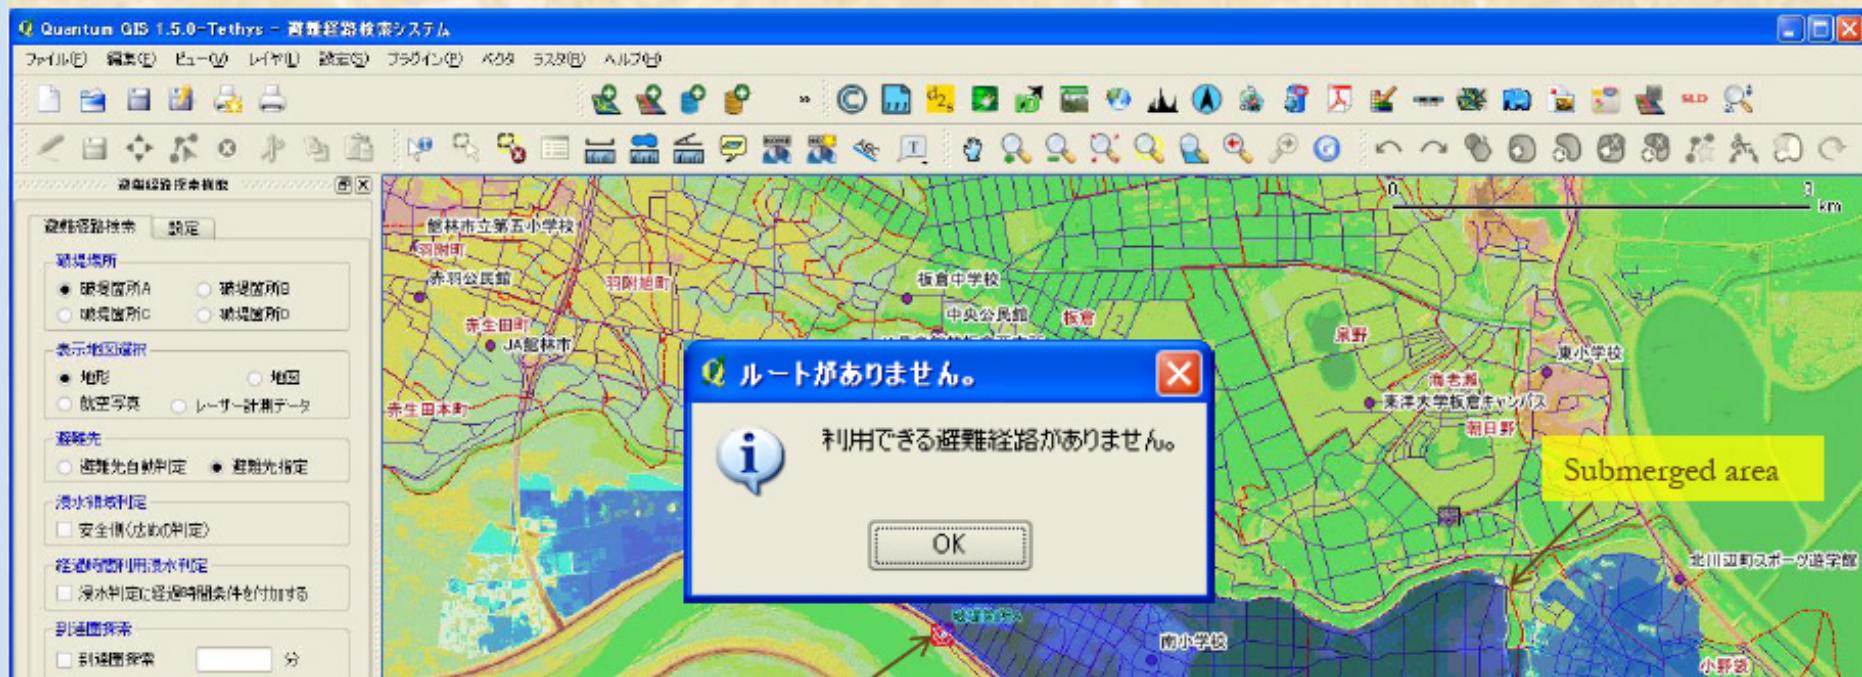

- Usually free to use
- Code base publicly available, public encouraged to contribute
- Can just use it, or also write code to make it better or fit your application
- Open source is not the same as open data

When to use open source

- When the overhead of acquiring expensive tools is high
 - Ideal for community groups
- When you don't want to explain what you're doing or ask for permission to do a unique project
- When you need to know how everything works

Community GIS Examples

There are no route to any shelter

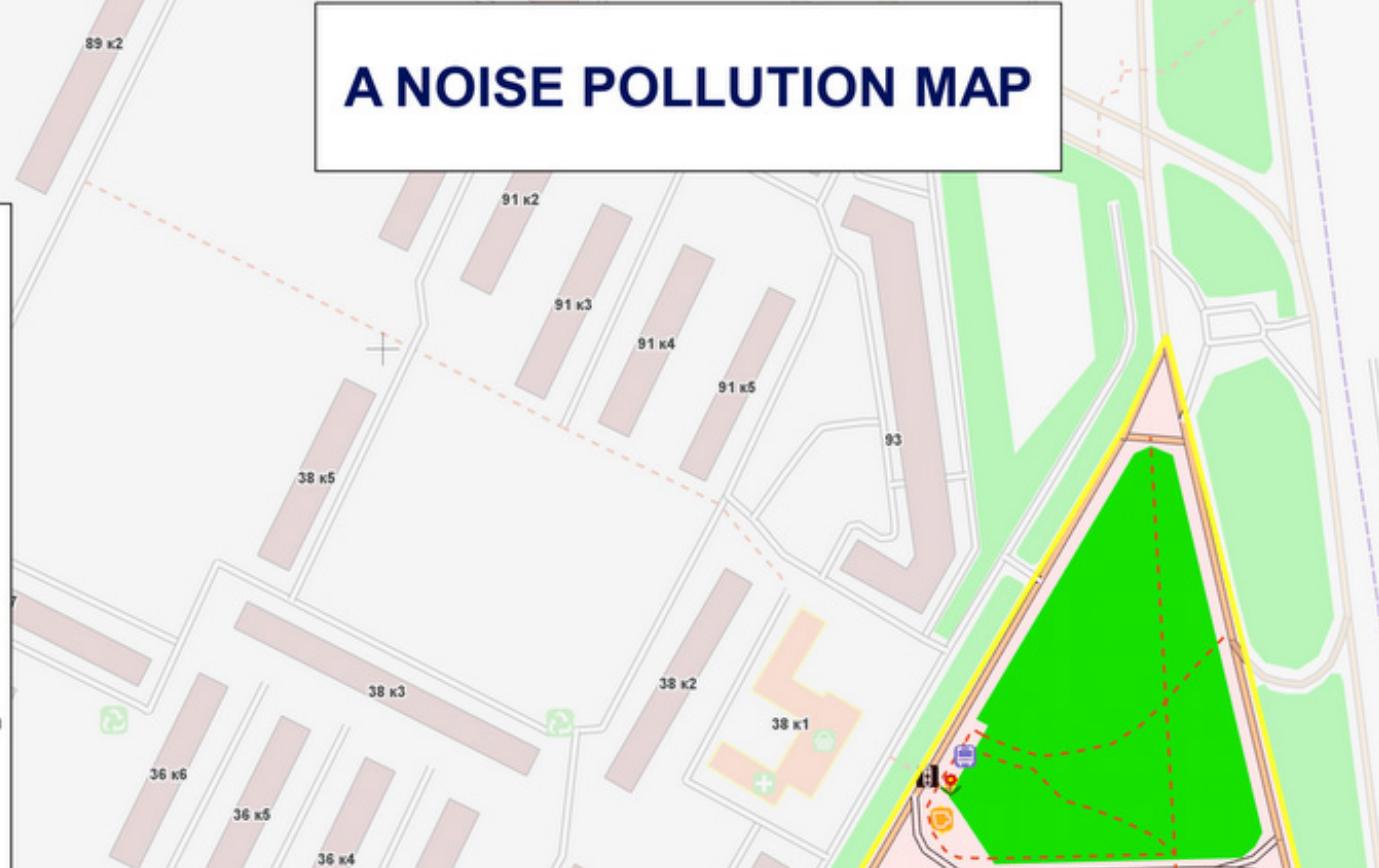

A NOISE POLLUTION MAP

Legend

Noise pollution

POI

-  ATM
-  bank
-  cafe
-  drinking water
-  fuel station
-  kindergarten
-  library
-  drugstore
-  pub
-  separate waste collection site
-  waste disposal site without separate collection
-  convenience shop
-  bath shop
-  florist's
-  shoemaker

Do you need maps?

Are you embroiled in an cartographic dispute? Do you disagree with the official version of your geography?..

This community began as the [Grassroots Mapping project](#), an effort to produce Do-It-Yourself satellite imagery [with balloons and kites](#), most notably during the **2010 BP oil spill**. We are now broadening our scope to explore new inexpensive and community-led means to measure and explore environmental and social issues

Programming in open source

Benefits

- *Full control if desired*
- *Structure for collaboration*
- *Richer toolbox*
- *Multi platform*
- *Programming skills you will develop have broad application*

Disadvantages

- *Time & cost to learn and maintain development environment*
- *Requires more general purpose programming skills*

Open source GIS tools

- GRASS - Desktop GIS
- QGIS - Desktop GIS
- PostGIS - Spatial relational database management system +
- OpenStreetMap - Open spatial data

Bonus: they all play well together!

The screenshot shows the GRASS GIS interface. The main window title is "GRASS GIS Map Display: 1 - Location: OregonNorthNad83_2269". The "GRASS GIS Layer Manager" window is open, showing three layers: "street_segments@katie" (selected), "street_segment_nodes@katie", and "Curb_Ramps@katie". A map view displays a network of streets with nodes marked by 'x' symbols. A context menu is open over a street segment, and an "Update attributes" dialog is displayed. The dialog shows fields for modifying a feature with ID 11132, including "node_to" set to 40571396, "name" set to "North_Denver_Avenue", and "highway" set to "tertiary". Other fields like "junction" and "ref" are empty. The "Feature id: 11132" field is highlighted. At the bottom of the dialog, there are "Close dialog on submit" and "Submit" buttons, along with "Reload" and "Cancel" buttons.

OpenStreetMap: open data

OpenStreetMap: open data

Example App: Curb ramp inventory

- Task: Create a mobile-friendly website that can be used by volunteers to do a curb ramp inventory
 - Free or very low cost
- Tools:
 - PostGIS
 - CartoDB
 - OpenLayers
 - HTML, javascript, jQuery, CSS

Step 1: Prepare dataset

- We had previously generated a walkway network from a street centerline file that included crosswalks, but what we needed was corners
- So, how do you turn this:

... into this?

... without ArcGIS?

Step 1: Prepare dataset

- Answer: With PostGIS!
- PostGIS not only manages your spatial data, it can run a number of really useful spatial functions *very quickly*
- All you have to do is write up some SQL
- ...and reuse it whenever you want!

7.8. Spatial Relationships and Measurements

`ST_Area` – Returns the area of the surface if it is a polygon or multi-polygon. For "geometry" type area is in SRID units. For "geography" area is in square meters.

`ST_Azimuth` – Returns the angle in radians from the horizontal of the vector defined by pointA and pointB

`ST_Centroid` – Returns the geometric center of a geometry.

`ST_ClosestPoint` – Returns the 2-dimensional point on g1 that is closest to g2. This is the first point of the shortest line.

`ST_Contains` – Returns true if and only if no points of B lie in the exterior of A, and at least one point of the interior of B lies in the interior of A.

`ST_ContainsProperly` – Returns true if B intersects the interior of A but not the boundary (or exterior). A does not contain properly itself, but does contain itself.

`ST_Covers` – Returns 1 (TRUE) if no point in Geometry B is outside Geometry A. For geography: if geography point B is not outside Polygon Geography A

`ST_CoveredBy` – Returns 1 (TRUE) if no point in Geometry/Geography A is outside Geometry/Geography B

`ST_Crosses` – Returns TRUE if the supplied geometries have some, but not all, interior points in common.

`ST_LineCrossingDirection` – Given 2 linestrings, returns a number between -3 and 3 denoting what kind of crossing behavior. 0 is no crossing.

`ST_Disjoint` – Returns TRUE if the Geometries do not "spatially intersect" – if they do not share any space together.

`ST_Distance` – For geometry type Returns the 2-dimensional cartesian minimum distance (based on spatial ref) between two geometries in projected units. For geography type defaults to return spheroidal minimum distance between two geographies in meters.

`ST_HausdorffDistance` – Returns the Hausdorff distance between two geometries. Basically a measure of how similar or dissimilar 2 geometries are. Units are in the units of the spatial reference system of the geometries.

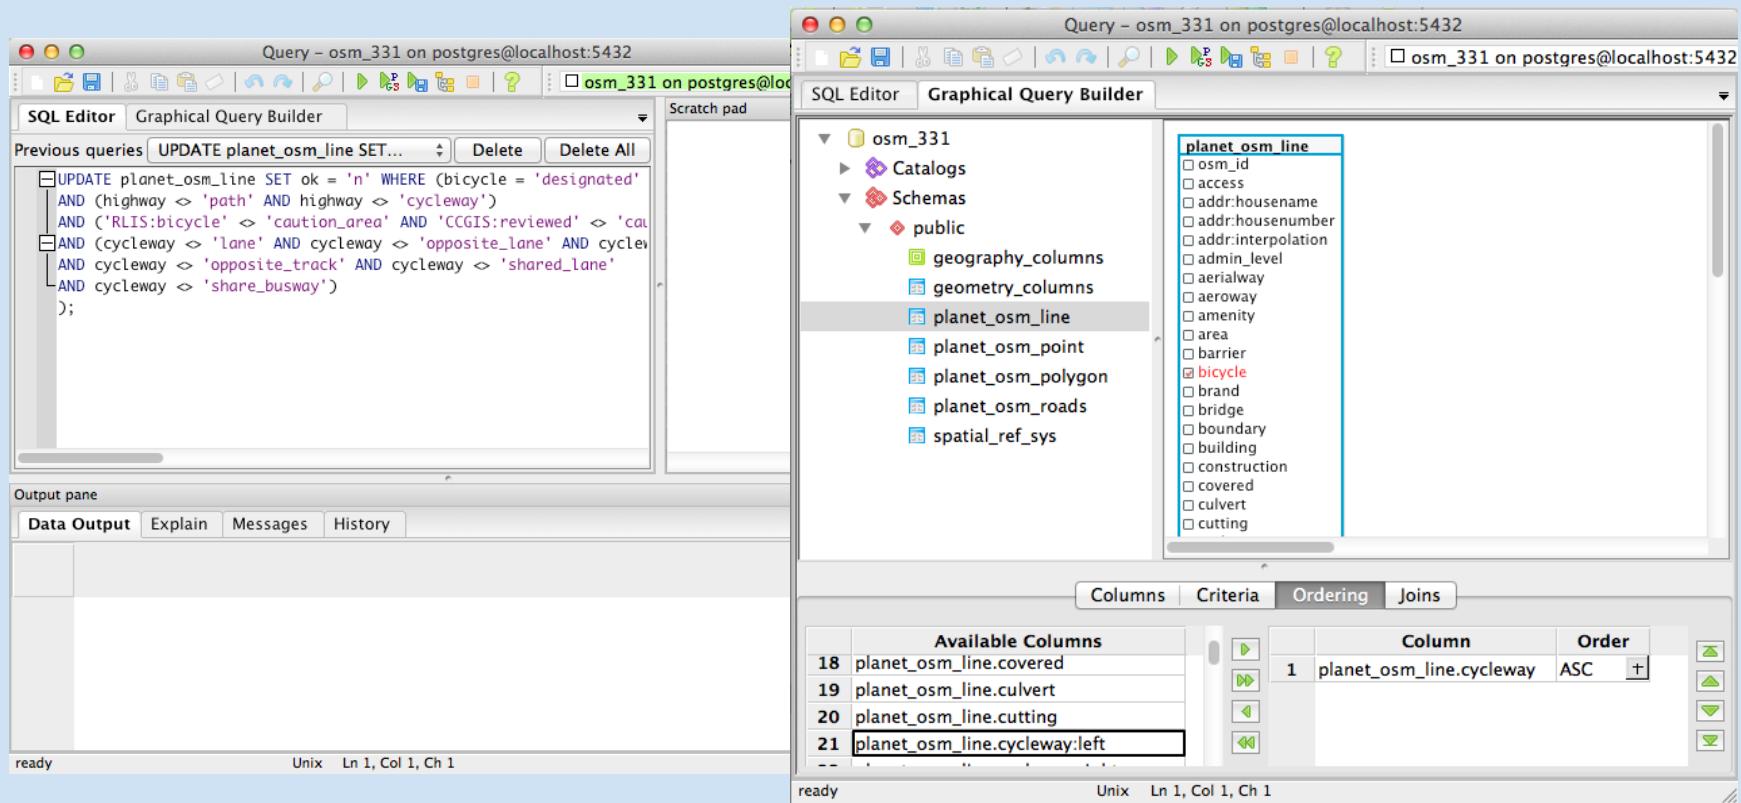

Step 1: Prepare dataset

- SQL is easy to learn
- PostGIS/PostgreSQL has great documentation and a broad user base
- This code creates a new table, then does an inner join of the crosswalk segments, using the function ST_StartPoint() to get the geometry of the point where the second of two touching crosswalks begins
- Finally, it brings in street names from a related table to give you a corner of X street and Y way

```
5
6 create table public.corner_pts (
7     id serial primary key,
8     intersection_id bigint,
9     fm_bearing int,
10    st_left_id bigint,
11    st_right_id bigint,
12    st_left_name text,
13    st_right_name text,
14    alignment text,
15    the_geom geometry
16 );
17
18 INSERT INTO public.corner_pts (intersection_id, fm_bearing,
19     st_left_id, st_right_id, alignment, the_geom)
20 SELECT DISTINCT
21     c1.to_end_id as intersection_id,
22     c1.fm_bearing,
23     c1.to_join_id as st_left_id,
24     c1.street_seg as st_right_id,
25     c1.alignment,
26     ST_StartPoint(c1.the_geom)
27 FROM public.corners c1, public.corners c2
28 where (c1.street_seg=c2.to_join_ID ---and c1.to_end_id=39265
29 );
30
31 update public.corner_pts set st_right_name = s.full_name
32 from public."Streets_pdx" s
33 where st_right_id = s.localid;
34
35 update public.corner_pts set st_left_name = s.full_name
36 from public."Streets_pdx" s
37 where st_left_id = s.localid;
```

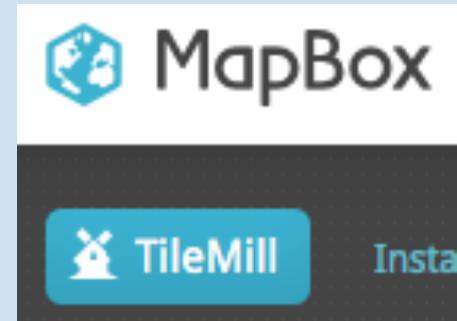

Creating SQL for PostGIS

Write your code in a text editor of your choice and paste it in the query window, or use the Graphical Query Builder

Step 2: Host the data

- There are many ways to display geographic data online, though you have two main options:
 - Tile your data or otherwise turn it into images
 - Host the data itself, making it truly interactive
 - With either, you can host data in the cloud or on your own web server
- Though affordable and easy open source options like MapBox & TileMill could provide some interactivity, a new tool called CartoDB was recently released that offered us exactly what we needed
- CartoDB = PostGIS in the cloud

CartoDB web interface

14 rows matching your query [CLEAR VIEW](#)

This query took 0.002 seconds

[Table](#) [Map](#) [SHARE THIS MAP](#)

	id	Intersectl	fm_bearing	st_left_id	st_rt_id	st_	Un

Table Map SHARE THIS MAP

Map type Roadmap Visualization type Carto Infowindow customization Custom

The image shows a screenshot of the CartoDB web interface. At the top, it displays a message "14 rows matching your query" and a "CLEAR VIEW" button. Below this, it says "This query took 0.002 seconds". There are three tabs: "Table" (selected), "Map", and "SHARE THIS MAP". The main area shows a table with columns: id, Intersectl, fm_bearing, st_left_id, st_rt_id, st_, and Un. The table contains 14 rows with various values. Overlaid on the table is a modal window titled "Add your custom SQL query". Inside the modal, there is a text area containing the SQL query "SELECT * FROM corners where evaluated = 'y'". Below the text area are two buttons: "Clear view" and "Apply query". To the right of the table, a map view is visible, showing street names like "NE Going St", "NE Cleveland Ave", and "NE Rodney Ave" with corresponding colored dots (orange, green, blue) indicating specific locations.

Step 3: Choose a web mapping library

OpenLayers

OpenLayers: Free Maps for the Web

{modest} maps

[Home](#) [Extensions](#) [Repository](#) [API Docs](#)

m

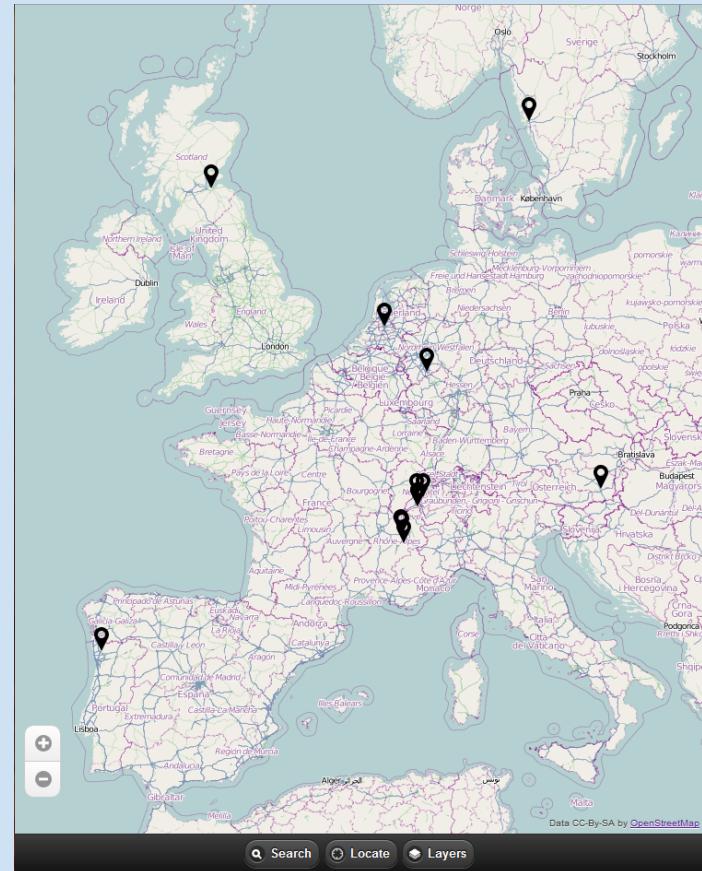

odest Maps is a small, extensible, and free library for designers and developers who want to use interactive maps in their own projects. It provides a core set of features in a tight, clean package with plenty of hooks for additional functionality.

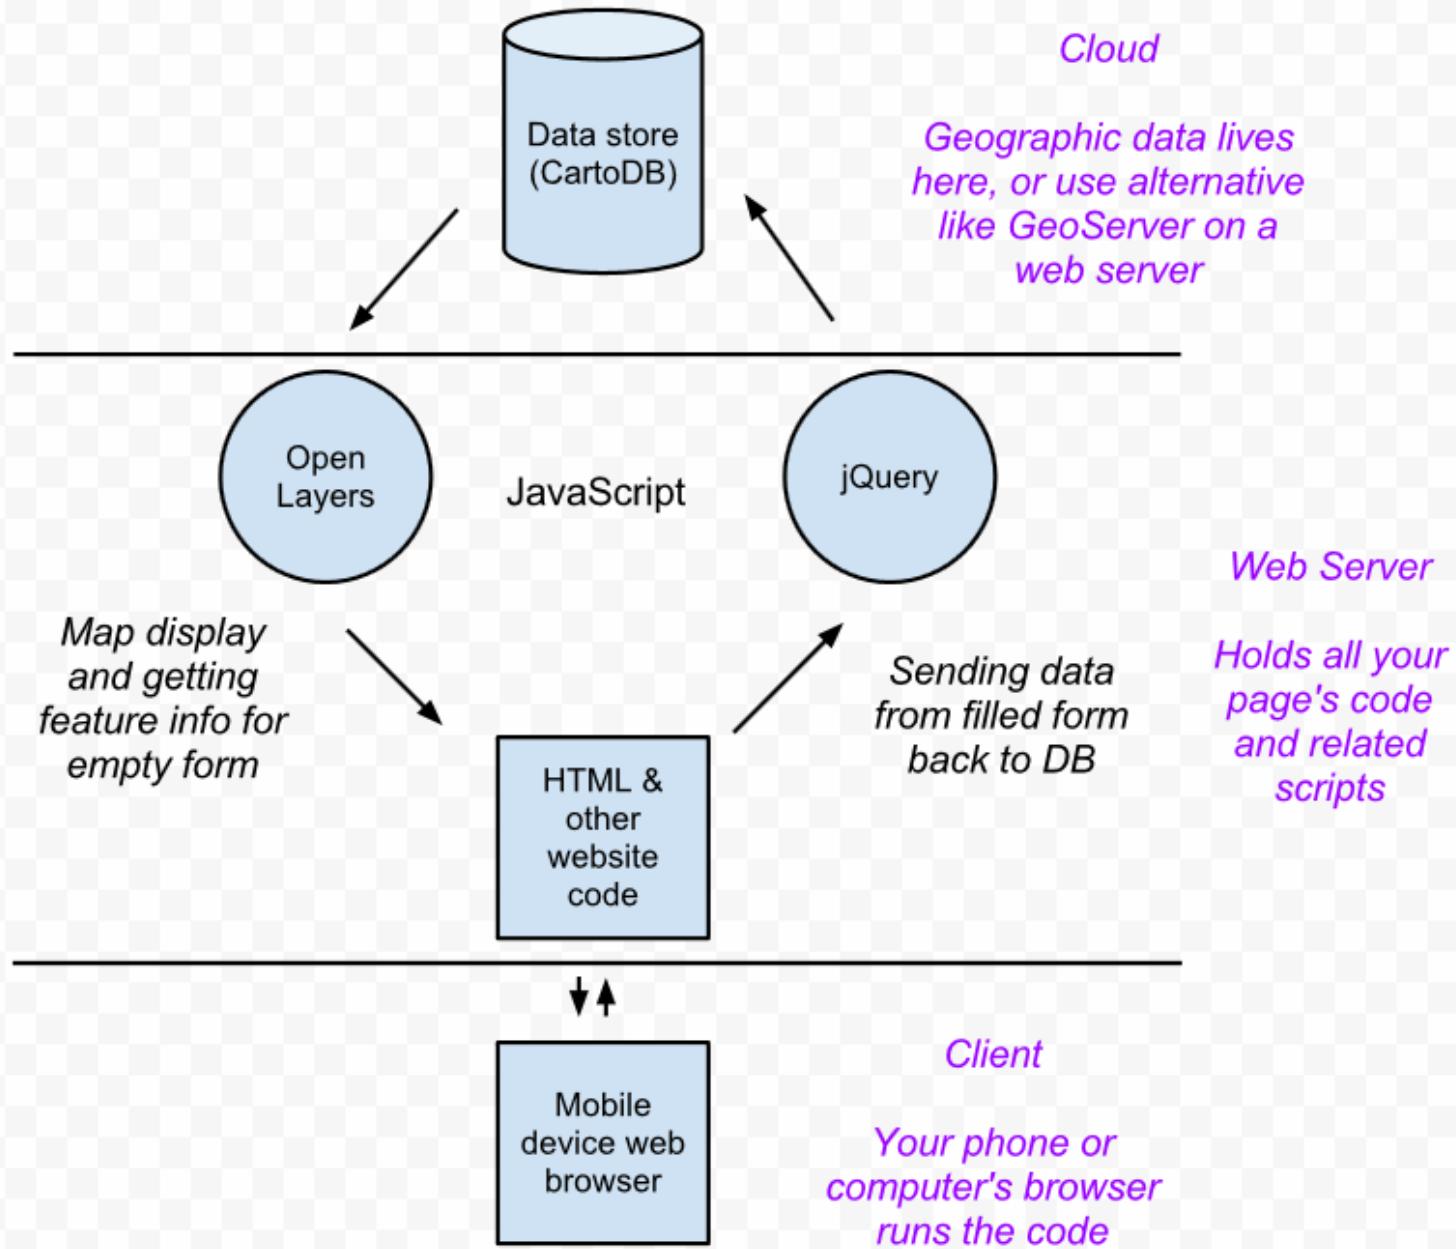

A Modern, Lightweight Open-Source JavaScript Library for Interactive Maps by [CloudMade](#)

Step 3: Choose a web mapping library

- I chose OpenLayers, since I was familiar with an example for mobile devices with most of the functionality I needed -- included start up HTML, javascript, jQuery, and CSS
- OpenLayers is powerful and well-established, but Leaflet or other libraries may have worked well too

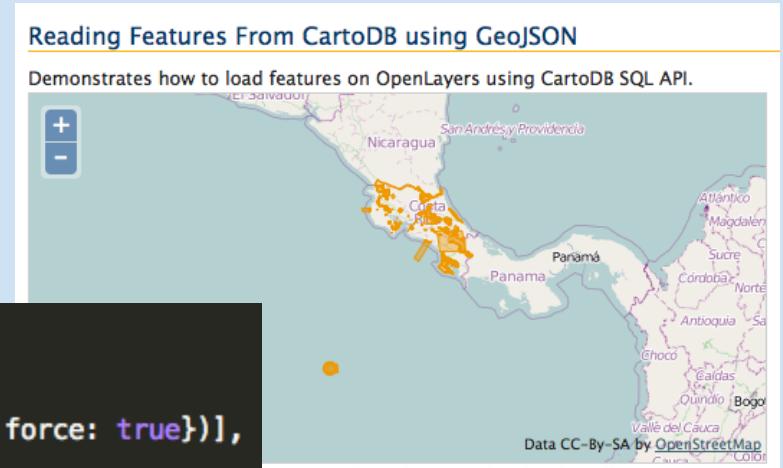

Step 4: Try to make it all work together

- Telling OpenLayers how to talk to CartoDB
 - Map - no examples

```
var cartoDB = new OpenLayers.Layer.Vector("Corners", {  
    projection: gg,  
    strategies: [new OpenLayers.Strategy.BBOX(),  
        new OpenLayers.Strategy.Refresh({interval: 60000, force: true})],  
    protocol: new OpenLayers.Protocol.Script({  
        url: "http://pdxmele.cartodb.com/api/v2/sql",  
        params: {  
            q: "select * from corners where evaluated is null",  
            format:"geojson"  
        },  
        format: new OpenLayers.Format.GeoJSON({  
            ignoreExtraDims: true  
        }),  
        callbackKey: "callback"  
    })  
});
```

Ask for help!

Step 4: Try to make it all work together

- Data
 - Populating forms
 - Sending forms
- Ask for help!

Edit details

Corner #3816
NE corner of N WILLIAMS AVE and NE SKIDMORE ST

How many curb ramps are there?

2

What is their condition?

Good

```
<script>
  //this function sends the form info to CartoDB
  function processCornerForm() {

    //grab the information from the form
    var id = document.getElementById("cornerID").innerHTML;
    var number = document.cornerForm.number.value;
    var condition = document.cornerForm.condition.value;
    var slope = document.cornerForm.slope.value;

    //put together the query
    var query = "q=UPDATE corners SET evaluated = 'y',
      number = '"+number+"', condition = '"+condition+"'
      , slope = '"+slope+"' where id = '"+id+"'
      &api_key=x";

    //for debugging
    //alert(query);
    //document.getElementById("querytest").innerHTML =
    query;

    //post the query!
    $.post("http://pdxmele.cartodb.com/api/v2/sql", query
      , alert ("Successfully posted to database"));
  }
}
```

Step 5: Refine and enjoy!

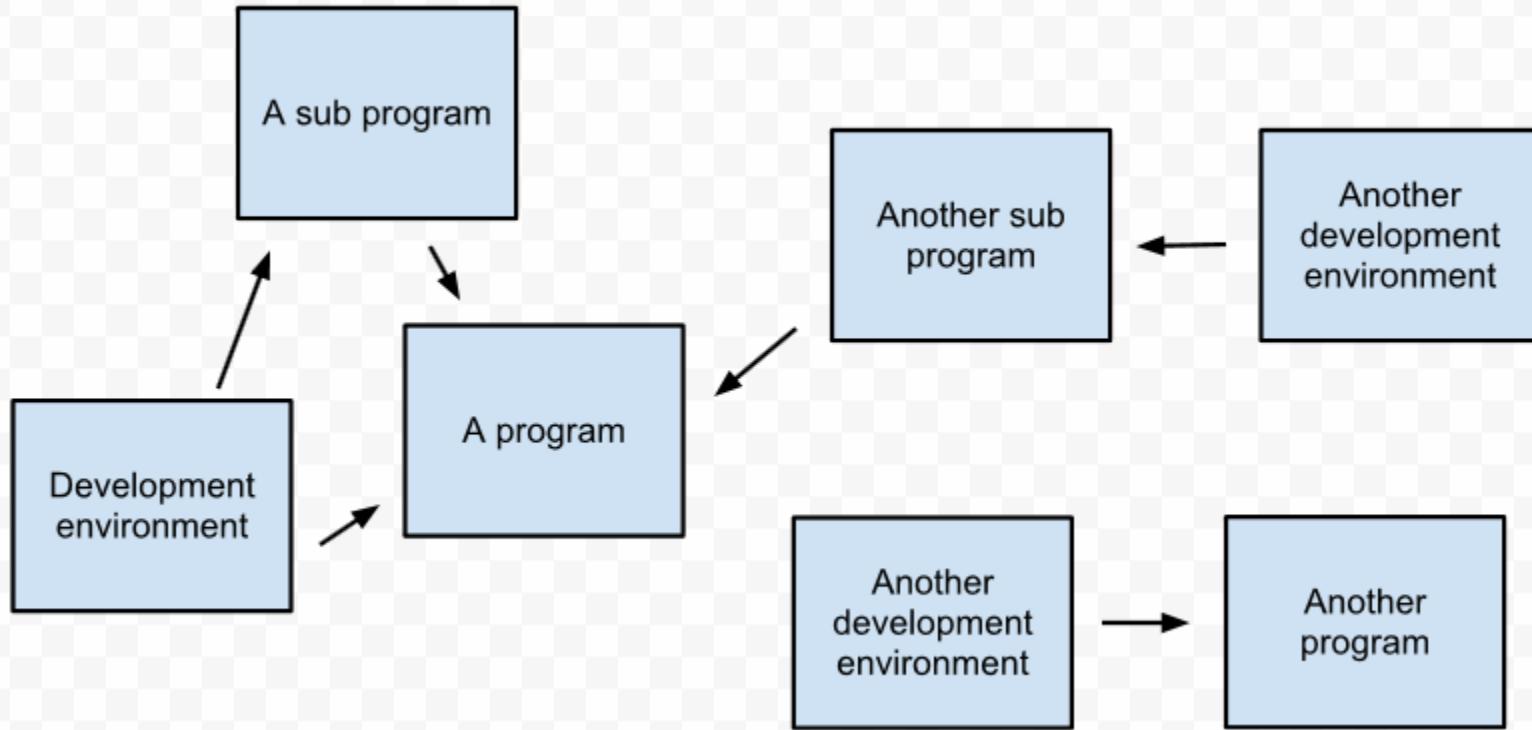

- Choosing base layers
 - OpenStreetMap
 - Bing aerials
 - MapBox?
- Refreshing data
- Playing with styling
- Seek better hosting
